

Bi- WEEKLY UPDATE

28 SEPTEMBER 2023

FROM THE TOP, DOWN

Thanks to the scaffolding around the building, we are able to access the roof and the incredible views over London. The metal sheeting and wire frame for the roof and the first floor have been secured, ready for the concrete slab to be poured over. This week we took the first steps towards the building being weather-proof and ready for work to begin on the inside.

MEN & MACHINES

Men and machines have worked together to place the metal and wire sheets within the steel framework. The cranes do the lifting.

The concrete mixers and large pourers deliver the concrete to the roof and first floor. It is then smoothed by skilled workmen to ensure that the levels are perfect, ready for the underfloor heating and floor coverings.
